

Prostate Imaging An Update.....

Mayfair Diagnostics Presentation
for ProstaId Calgary
March 12, 2019

Outline

- Shelley Spaner -
 - review of prostate cancer diagnosis, discussion of the expanded role of MRI and brief review of relevant literature
- Brendan Diederichs –
 - Overview of the new 3Tesla MRI at the Rockyview General hospital with case examples
- Grace Yeung –
 - Overview of the targeted biopsy program at the Rockyview General hospital

Prostate Cancer in Canada

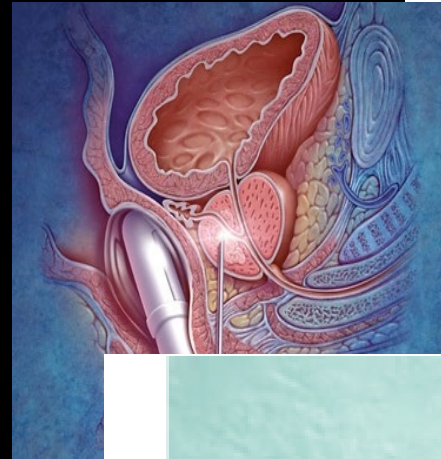

- Prostate cancer is the most commonly diagnosed cancer in Canadian men
- Third leading cause of cancer death, behind lung and colorectal cancers
- Rate of newly diagnosed cases:
 - increased by ~1.1% year from 1995 - 2006
 - decreased by ~ 3.8% per year from 2006 -12
- The rate of deaths from prostate cancer decreased by an average of 2.9% per year from 1995 to 2012
- From 1995 to 2012:
 - the median age at diagnosis decreased from 71 to 67
 - the median age of death increased from 78 to 82

Ellison, Lawrence. 2016. "Prostate cancer trends in Canada, 1995 to 2012." *Health at a Glance*. Statistics Canada Catalogue no. 82-624-X.

Diagnosing Prostate Cancer....

- Elevated PSA and/or abnormal DRE
- US guided needle biopsy is needed to confirm diagnosis
- 5-7.5 MHz transrectal probe
- Systematic sextant core biopsies are obtained

**18-gauge prostate
needle biopsy core
specimen.**

Limitations of Transrectal Biopsy

- Cancer is missed in 10-38 % of patients with prostate cancer
- Prostate apex, lateral and anterior cancers are not well evaluated with standard sextant biopsy
- Total volume of core extracted is small in comparison with gland volume [$< 1\%$]
- Underestimate Gleason grade in up to 46 % of cases

Over detection of low-grade microfocal cancers of little clinical significance

Under detection of large clinically significant cancers

Diagnosis made...Now what....

Investigations for staging

Assessment for patient's considering active surveillance or treatment with curative intent should consist of:

- History and physical examination
- Blood tests - CBC, creatinine, urinalysis, PSA
- Nuclear Medicine bone scan-
 - indicated for those with high risk disease
- CT imaging
 - indicated for those with high-risk disease

Diagnosis made...Now what....

Investigations for staging

Staging -

MRI is not routinely recommended

Active Surveillance -

- MRI can be considered if there is discordance between the clinical and pathological information

Controversies in Screening.....

- 44 % reduction in prostate cancer mortality in the last 20 years
 - 45-70% reduction attributable to PSA screening
- USPSTF (2012) recommended against PSA screening, citing over diagnosis and over treatment of indolent tumors
- PIVOT suggests focus of screening should be on selectively identifying potentially aggressive cancers

MARCH 30, 2017

-that there is still no clarity about the usefulness and desirability of routine PSA-based screening after 25 years and two large trials suggests that its net benefit is unlikely to be more than marginal, whereas the harms are proven and substantial.Under the “first do no harm” principle, it seems reasonable to forgo mass screening as a public health policy at this point but to continue to perform research on how to reduce the harms of PSA screening while maintaining any benefits.
- There is a critical need for strategies to reduce the burdens associated with the diagnosis of indolent disease, through a combination of not diagnosing it in the first place and accurately classifying it as not needing any further follow-up or treatment, while still maintaining any mortality benefits for men with aggressive disease..... Perhaps that is the most pressing research challenge going forward.
- What can we do to differentiate indolent from aggressive cancers?

The Future of Prostate Imaging

- High resolution ultrasound
- Contrast enhanced ultrasound
- Mp-MRI
- Molecular Imaging

NHS APPROVES TRIAL FOR DOGS DETECTING PROSTATE CANCER

GARY TROTTER

<http://food4petreviews.com/news/nhs-approves-trial-for-dogs-detecting-prostate-cancer.html>

The emerging role of MRI

The Past.....

- Introduced in the 1980s
- Limited capability to distinguish clinically significant prostate cancer from insignificant cancer

Preamble.....

The ideal test for prostate cancer would be:

- Minimally invasive
- Have few side effects
- Identify a high proportion of men who would benefit from treatment
- Minimize the identification of men with clinically insignificant cancer in order to prevent overtreatment.....

March 19, 2018 - PRECISION Trial

(Prostate Evaluation for Clinically Important disease: Sampling using Image guidance or not)

MRI-Targeted or Standard Biopsy for Prostate-Cancer Diagnosis

Veeru Kasivisvanathan, M.R.C.S., Antti S. Rannikko, Ph.D., Marcelo Borghi, M.D., Valeria Panebianco, M.D., Lance A. Myrander, M.D.,
Markku H. Vaarala, Ph.D., Alberto Briganti, Ph.D., Lars Budäus, M.D., Giles Hellawell, F.R.C.S.(Urol.), Richard G. Hindley, F.R.C.S.
(Urol.), Monique J. Roobol, Ph.D., Scott Eggener, M.D., et al., for the PRECISION Study Group Collaborators*

The Trial....

- From February 2016 through August 2017, a total of 500 participants underwent randomization
- 252 participants were assigned to the MRI-targeted biopsy group
- 248 to the standard-biopsy
- The characteristics of the participants at baseline were similar in the two groups
- A total of 71 of 252 participants (28%) in the MRI-targeted biopsy group had a result on MRI that was not suggestive of prostate cancer (PI-RADS v2 score, ≤ 2), and so they did not undergo biopsy
- Among the participants with a positive result on MRI, 51 of 175 (29%) had a PI-RADS v2 score of 3, 70 (40%) had a score of 4, and 54 (31%) had a score of 5
- The remaining 6 men did not complete the MRI

PRECISION Trial

(Prostate Evaluation for Clinically Important disease: Sampling using Image guidance Or Not)

- In men with a clinical suspicion of prostate cancer who had not undergone prostate biopsy previously, the PRECISION trial showed that MRI, with or without targeted biopsy, led to:
 - fewer men undergoing biopsy (~1/4 of men avoided bx)
 - more clinically significant cancers being identified
 - less overdetected of clinically insignificant cancer
 - fewer biopsy cores being obtained than standard TRUS bx
 - 30-day participant-reported side-effect profile more favorable in the MRI-targeted biopsy group than in the standard-biopsy group

Outcomes.....

- Clinically significant cancer was detected in 95 men (38%) in the MRI-targeted biopsy group, as compared with 64 (26%) in the standard-biopsy group
- Fewer participants received a diagnosis of clinically insignificant cancer in the MRI-targeted biopsy group than in the standard-biopsy group (23 men [9%] vs. 55 [22%])
- A greater percentage of cores were positive for cancer in the MRI-targeted biopsy group (422 of 967 cores [44%]) than in the standard-biopsy group (515 of 2788 [18%])

Key strengths – size and pragmatism

- Allowed nonacademic centers outside the original expert group to take part.
- Either 1.5-T or 3.0-T MRI machines were permitted
- Endorectal coil was permitted but not required.
- Various techniques of MRI-targeted biopsy, with visual registration or software-assisted registration
- Transrectal or transperineal access routes, were permitted
- On average, MRI with or without targeted biopsy was conclusively superior to standard transrectal ultrasonography–guided biopsy.

Limitations.....

- Concerns about the men with negative results on MRI who do not undergo biopsy.
- It has been shown that these men have a low risk of clinically significant cancer, but nonetheless, follow-up with monitoring of the PSA level is routine, reasonable, and safe.

Limitations....

- It is possible that clinically significant cancers may have been missed by the omission of standard biopsy cores in men in the MRI-targeted biopsy group

- We acknowledge that the acquisition and reporting of MRI of the prostate are specialist skills with a learning curve and that the radiologists involved in this trial were reporting a high volume of MRIs per year (median, 300 MRIs per year).
- We acknowledge that a change in the standard of care for prostate-cancer diagnosis would entail changes in health care systems to accommodate appropriate MRI capacity and to meet the training needs of radiologists and urologists.
- From a health economics perspective, the cost savings with MRI, with or without targeted biopsy, over standard TRUS biopsy may emerge from the earlier detection of clinically significant cancers, fewer cases of insignificant cancer diagnosed, and fewer repeat biopsies.

Conclusion.....

- in men with a clinical suspicion of prostate cancer, we found that a diagnostic pathway including risk assessment with MRI before biopsy and MRI-targeted biopsy in the presence of a lesion suggestive of cancer was superior to the diagnostic pathway of standard transrectal ultrasonography–guided biopsy.

The potential implications of this trial:

- A redefining of the prostate cancer diagnostic pathway
- A reduction in the number of patients undergoing prostate biopsy
- A reduction in the number of biopsy cores taken per patient
- A reduction in biopsy related sepsis, pain and other side effects
- A reduction in the over diagnosis of clinically insignificant prostate cancer
- A reduction in the economic burden of diagnosing and treating prostate cancer

MRI for all men suspected of prostate cancer could save thousands of lives - new study

2

MRI caught 12 per cent more cases of dangerous prostate cancer. CREDIT: PHILIP HOLLIS FOR THE SUNDAY TELEGRAPH/ PHILIP HOLLIS FOR THE SUNDAY TELEGRAPH

By **Henry Bodkin**

19 MARCH 2018 • 6:28PM

Giving all men with suspected prostate cancer an immediate MRI scan would save thousands of lives a year, the results of a new study suggest.

A trial by British scientists found the comprehensive scan was 12 per cent more likely to detect dangerous tumours than the traditional biopsy, and that the number of men who undergo a biopsy needlessly could be reduced by 28 per cent.

Every year more than 120,000 men in the UK undergo a biopsy, which involves inserting an ultrasound probe into the affected area to take a sample of cells from the prostate that might contain cancer.

Today, [Dr Veeru Kasi](#) of University College London, presented the results of the PRECISION (PRostate Evaluation for Clinically Important disease: Sampling using Image-guidance Or Not?) study in the "Game Changing" Plenary session at the #EAU18 Annual Meeting in Copenhagen. The accompanying paper was simultaneously published in the [New England Journal of Medicine](#). And it is stunning! Everyone in the packed eURO auditorium knew they were witness to a practice-changing presentation, and the swift reaction on social media around the world confirms this.

Abstract

Importance In the United States, the lifetime risk of being diagnosed with prostate cancer is approximately 13%, and the lifetime risk of dying of prostate cancer is 2.5%. The median age of death from prostate cancer is 80 years. Many men with prostate cancer never experience symptoms and, without screening, would never know they have the disease. African American men and men with a family history of prostate cancer have an increased risk of prostate cancer compared with other men.

For men aged 55 to 69 years, the decision to undergo periodic PSA-based screening for prostate cancer should be an individual one and should include discussion of the potential benefits and harms of screening with their clinician. Screening offers a small potential benefit of reducing the chance of death from prostate cancer in some men.

In determining whether this service is appropriate in individual cases, patients and clinicians should consider the balance of benefits and harms on the basis of family history, race/ethnicity, comorbid medical conditions, patient and other health needs.

The USPSTF recommends against PSA-based screening for prostate cancer in men 70 years and older.

2019 Genitourinary Cancer Symposium

- Historically, mpMRI only used for staging purposes after prostate cancer diagnosis
- Recently, mpMRI is becoming utilized for pre-biopsy disease localization and for risk stratification in men with a borderline or elevated PSA
- Greater than 95% of patients at NYU receive a mpMRI during their prostate cancer evaluation
- Pre-biopsy mpMRI and MRI-targeted biopsy allows for improved high-grade cancer detection while minimizing the diagnosis of indolent prostate cancers.
- There remain the issues of cost, reproducibility, and quality control that are hurdles to the broad implementation of mpMRI in all men with suspicion of prostate cancer
- Future studies will help improve the adoption of this technology over time.

Conclusion.....

- in men with a clinical suspicion of prostate cancer, we found that a diagnostic pathway including risk assessment with MRI before biopsy and MRI-targeted biopsy in the presence of a lesion suggestive of cancer was superior to the diagnostic pathway of standard transrectal ultrasonography–guided biopsy.

PROSTATE MR AT THE ROCKYVIEW GENERAL HOSPITAL: AN UPDATE

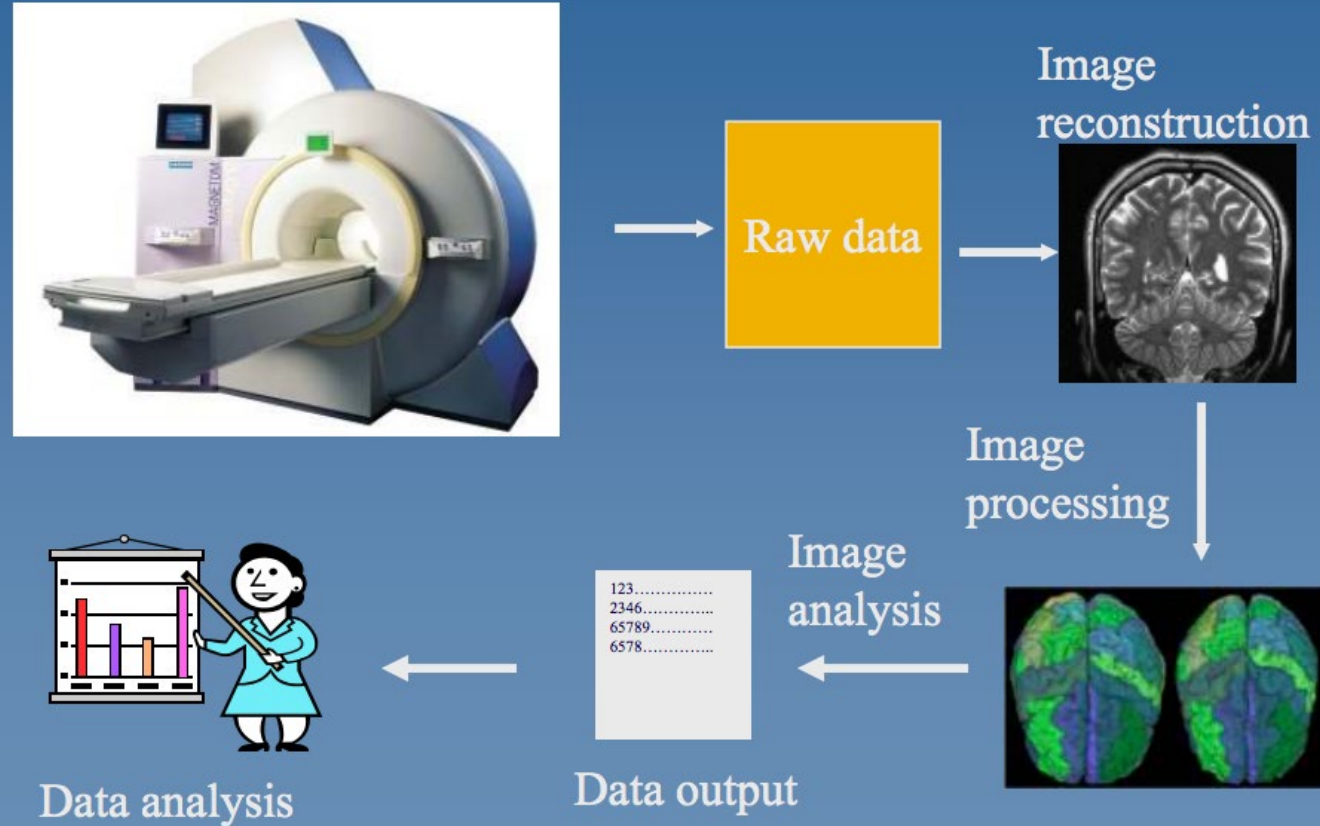

In December 2017 a proposal was made on was made to AHS to upgrade outgoing 1.5 T with an advanced 3T system

A stated primary goal in this proposal included high level DI support to Urology as the patient and family centric Centre of Excellence for Southern Alberta at RGH

Additional stated goal to expand the regional capacity for 3T imaging research in Urology, Body imaging, MSK, and Ophthalmology

PROSTATE MR AT THE ROCKYVIEW GENERAL HOSPITAL: AN UPDATE

Brief update on step one: establishment of a robust core prostate mpMRI protocol at the Urology Centre of Excellence for Southern Alberta.

MRI BASICS IN 10 SECONDS

- a) lining up protons in a patient along a magnetic field
- b) deflecting, tilting or flipping protons in a variety of sequences to generate differences in spin or orientation to provide contrast according to tissue type or environment
- c) listen to the "signal" emitted back from the patient as protons "relax" back to alignment with the magnetic field

MRI BASICS IN 10 SECONDS

MR can generate a huge variety of tissue contrasts based on how protons differently react to a series of radiofrequency pulses or magnetic gradients within a static magnetic field.

These are boiled down to simple "flavours" of imaging sequences based on their relative weighting (T1, T2) though in reality this weighting is relative (on a sliding scale) and the amount of imaging variables can be thought of as an order of magnitude greater than other imaging modalities.

PROSTATE MRI BASICS

Current Regional Indications:

1. High PSA/clinical suspicion for significant cancer, negative systematic biopsy: are we missing treatable malignancy?
2. Known high risk cancer, pre-operative staging: where is the cancer and how specifically should surgery be performed?
3. Active surveillance monitoring in known low risk cancer: do we need to re-biopsy?

PROSTATE MRI BASICS

"Designed to promote global standardization and diminish variation in the acquisition, and interpretation of prostate mpMRI examinations and it is intended to be a “living” document that will evolve as clinical experience and scientific data accrue. PIRADS v2 needs to be tested and validated for specific research and clinical applications."

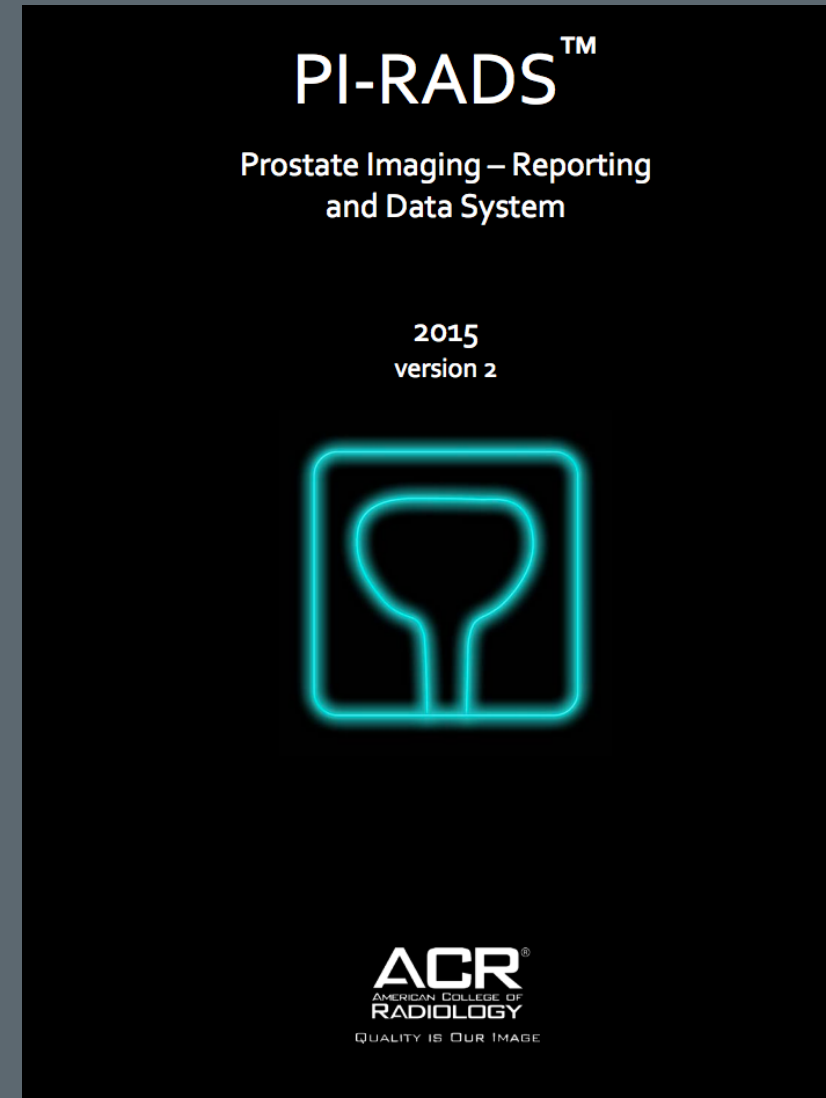

PROSTATE MRI BASICS

PI-RADS v2 gives us a common language and a baseline minimum framework to work with

PROSTATE MRI BASICS

"it does not elucidate or prescribe optimal technical parameters"

Axial T2W images acquired at 3-T using surface arrays coils. All acquisitions fulfilled the recommendations stated in PI-RADs v2. However, substantial differences in acquisition times and image quality can be noted: (a) acquisition time is 2 min 55 s; (b) acquisition time is 2 min 30 s; (c) acquisition time is 2 min 20 s; (d) acquisition time is 2 min 55 s; (e) acquisition time is 3 min 10 s; (f) acquisition time is 3 min 7 s. All images have the same windowing.

"strict adherence to PI-RADs guidelines is not sufficient to ensure the best image quality with an acceptable acquisition time"

VARIABLES IN MRI

Field Strength

Prostate MRI is currently acquired using a 1.5-T or 3-T MR scanner.

Higher field strength provides a higher signal-to-noise ratio (SNR).

Induced MR signal in a receiver coil is proportional to the square of the main magnetic field (B_0) while the noise has a linear dependence at field strengths > 1.0 -T. Thus, the theoretical SNR gain of the 3-T vs. 1.5-T is two times higher.

In reality, several real-world limitations make the real SNR gain of 3-T vs. 1.5-T in the range of 1.5–1.8 x

VARIABLES IN MRI

Field Strength

Although prostate MRI at both 1.5 T and 3T has been well established, most members of the PI-RADS Steering Committee prefer, use, and recommend 3T for prostate MRI

CRITICAL DWI VARIABLES

In prostate imaging, high cellularity in cancerous tissue means more cell membranes = brighter signal

b-value is a parameter that specifies the degree of diffusion weighting

CRITICAL DWI VARIABLES

Axial T2W image ((a), arrow points to prostate cancer lesion) and trace DWI images of $b = 0$ (b), 300 (c), 600 (d), 900 (e), 1200 (f), 1500 (g), 1800 (h), 2100 (i), 2400 (j), 2700 (k), and 3000 (l) s/mm² of a patient (the same patient as in Fig. 9) with histologically confirmed Gleason score 4 + 3 prostate cancer demonstrate increasing contrast between the cancer lesion and benign tissue with increasing b-values

CRITICAL DWI VARIABLES

PI-RADS mandates an evidence supported recommendation that high b-values must be used.

Minimum is 1400 (currently used in region) but there is evidence that even higher may offer superior test characteristics

Must balance b-value vs. tradeoff in imaging quality

CRITICAL DWI VARIABLES

To increase b-value, the system must either increase the diffusion gradient strength OR the time between gradients

Problem: increasing time between gradients (TE) results in a sharp drop-off in SNR and a large increase in artifacts

CRITICAL DWI VARIABLES

Examples of rectal gas: extremely common on regional 3T protocols to date at $b=1400$, not encountered at 1.5T

CRITICAL DWI VARIABLES

DYNAMIC CONTRAST ENHANCEMENT

Role limited to moving a particular subset of PI-RADS 3 to 4.

Either positive or negative

Criteria for positivity: "enhancement focal, and; earlier than or contemporaneously with enhancement of adjacent normal prostatic tissues, and; corresponds to suspicious finding on T2W and/or DWI"

Core requirement: "Temporal resolution: ≤ 10 sec (<7sec is preferred)"

RGH DCE

Brand new sequence "GRASP-VIBE" originally developed to allow free breathing liver MRI

Highly-accelerated volumetric dynamic MRI technique allows previously impossible combinations of temporal resolution, spatial resolution and volumetric coverage

RGH: turned sequence on its head to leverage temporal resolution where motion correction is less important

Prostate Biopsy

Grace W.S. Yeung, MD, FRCPC

DIAGNOSTICS / IN-HOSPITAL / TELERADIOLOGY

Topics:

- Historical background and Relevance
- Transrectal Ultrasound Guided Biopsy
- MRI guided targeted biopsy
- Targeted biopsy program at Rockyview General Hospital

RELEVANCE

Why should we care?

Prostate cancer screening and detection

- Prostate Specific Antigen (PSA)
 - Increased rate of cancer detection
 - Role in cancer related mortality reduction debated
 - Low specificity
 - Clinically significant cancer in patients with PSA <4nG/mL
- Systematic trans-rectal ultrasound (TRUS) guided biopsy
 - 12 point biopsy

Maddams J, Utley M, Møller H. Projections of cancer prevalence in the United Kingdom, 2010–2040. *Br J Cancer* 2012; 107:1195–1202

Etzioni R, Tsodikov A, Mariotto A, et al. Quantifying the role of PSA screening in the US prostate cancer mortality decline. *Cancer Causes Control* 2008; 19:175–181

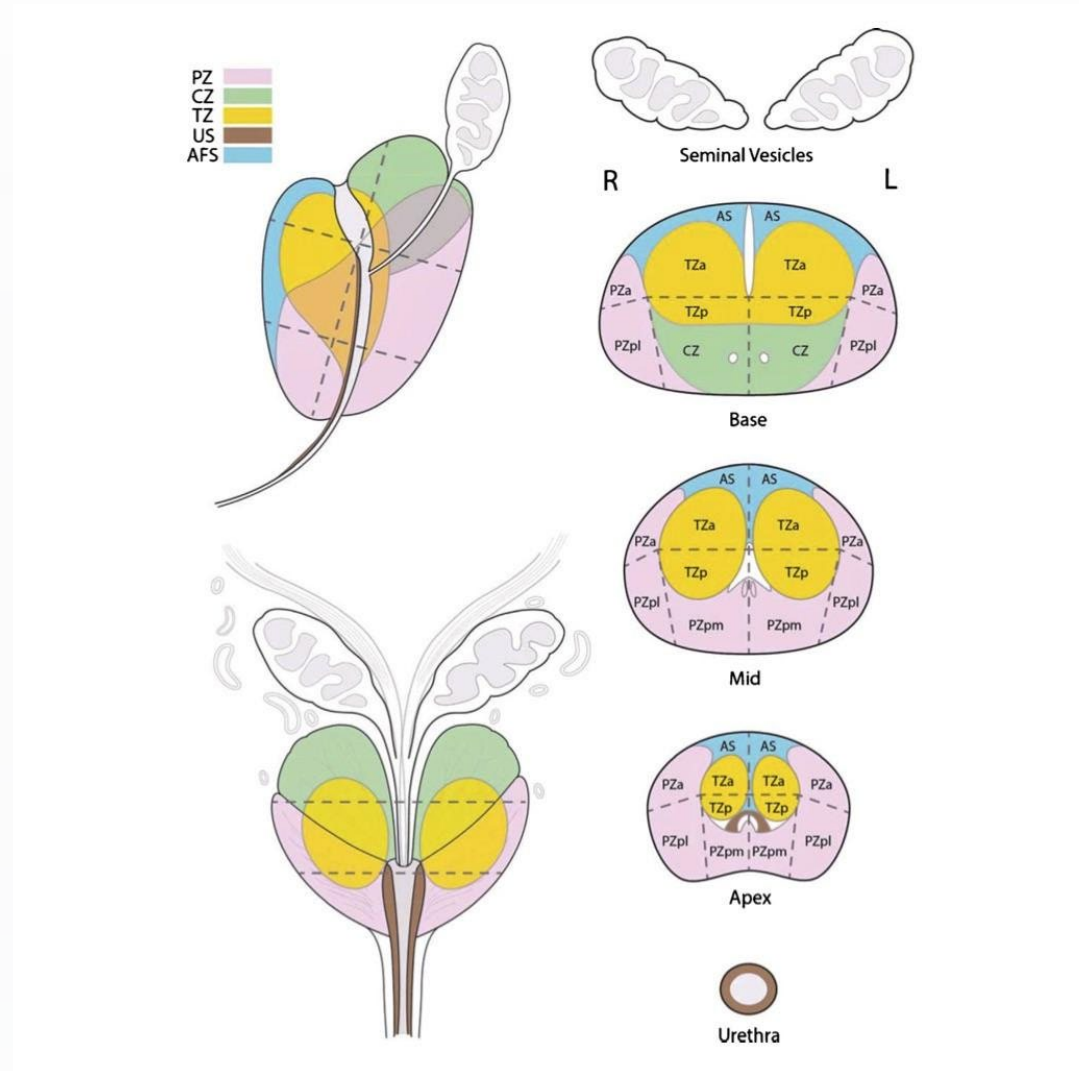

TRUS biopsy

- Bowel preparation
- Prophylactic antibiotics
- Analgesia
 - Sedation
 - Topical local anaesthetic
 - Regional block

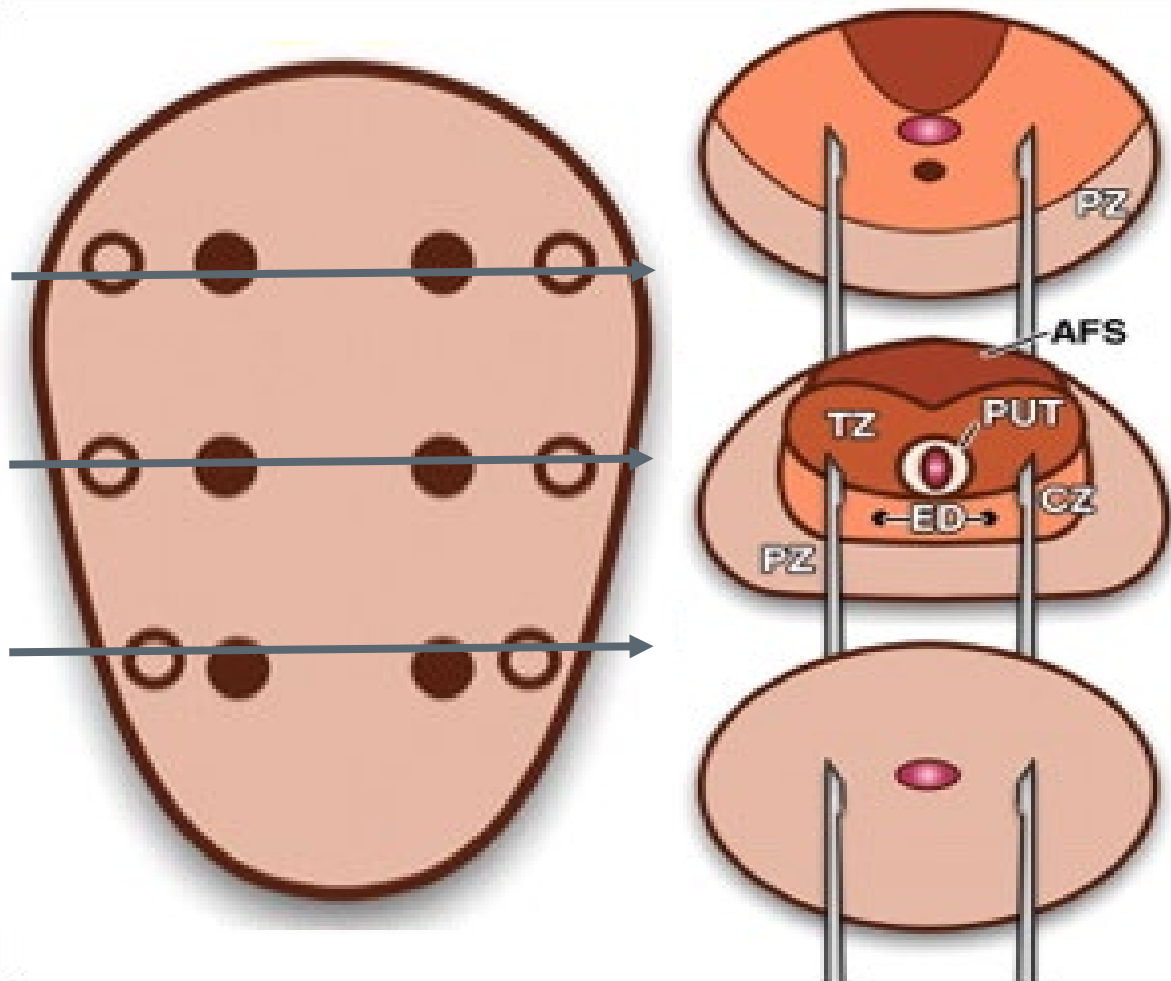

TRUS biopsy

- 70% peripheral zone
- 25% transitional zone
- 5% central zone

12 point Systematic TRUS

RISKS/COMPLICATIONS

Bleeding

Infection

Urinary Symptoms

Bleeding

- Type:
 - Hematuria: 10-84%
 - Hematospermia: 1-93%
 - Hematochezia: 1-45%
- Severe
 - <1%
- Independent of core number (6-12)
 - Exception hematospermia

Infection

- 0-6% rates of hospitalization
- Type:
 - UTI
 - Epididymitis
 - Meningitis/Osteomyelitis
 - Sepsis
- Infection rates increasing over time
 - Antibiotic resistance
- Risk factors
 - More cores
 - Repeat biopsy

Lower Urinary Tract Symptoms

- Lower urinary tract symptoms/urinary retention: 0.2-1.7%
- Dysuria 6-25%
- Reduction technique
 - α blockers

OPTIMIZATION OF BIOPSY TECHNIQUE

Antibiotic
Analgesia
Approach

Biopsy optimization

- Antibiotic prophylaxis
 - Fluoroquinolones
 - Ciprofloxacin po for 3 days
 - Expanding antibiotic regimen
 - Rectal swab cultures and targeted antibiotic regimen
 - Changing technical technique

- AHS currently investigating new prophylaxis regimen

Pain management

- Sedoanalgesia
- Periprostatic Nerve blockade
 - 10-20cc 1% lidocaine
 - Apical/basal blockade or combination
- Topical lidocaine
- Strong evidence to support analgesia

Transperineal

- Increasing in popularity
- Comparative studies fail to show difference in complication rates

LIMITATIONS

TRUS limitations

Limitations of TRUS biopsy

- Samples 1% of gland
 - Low sensitivity
 - High false negative
 - Repeat biopsy
 - Diminishing detection rate
- Misrepresentation of the grade of cancer
- Anterior zone
- Morbidity and mortality

Goal of biopsy

- Minimize the need for biopsy
- Maximize the yield:
 - Detect clinically significant cancer

MRI TARGETED BIOPSY

Is this the future?

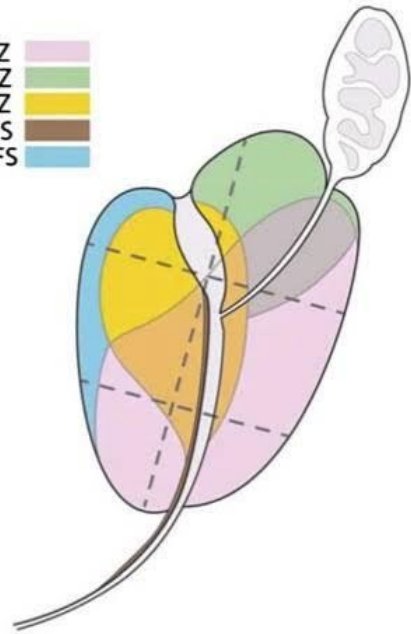

Yield of standard vs targeted biopsy

- PRECISION trial
 - MRI-targeted biopsy was superior to standard TRUS in men at clinical risk for prostate cancer who had not undergone biopsy previously.
- European Journal of Radiology
 - January 2018
 - Targeted biopsy using mpMRI-TRUS fusion has incremental diagnostic value in comparison to conventional random biopsy, better detecting clinically significant prostate cancers.

Case

- CZ 
- TZ 
- US 
- AFS 

Seminal Vesicles

R L

Base

Mid

Apex

Urethra

Case outcome

Patient PSA: 12

2 prior biopsies:

2015: Atypical cells

2013: Benign

Diagnosis: Gleason 7 carcinoma

Goals of MRI targeted biopsy

- Minimize the need for biopsy
- In cases of diagnosed cancer
 - Tissue sampling of the most clinically relevant region
- In cases of no cancer detection
 - True negative biopsy

TRUS biopsy

```
graph TD; A[TRUS biopsy] --> B[Detection of clinically significant prostate cancer]; A --> C[No or low grade cancer]; B --> D[Treatment]; C --> E[Active Surveillance];
```

Detection of clinically significant prostate cancer

Treatment

No or low grade cancer

Active Surveillance

TARGETED BIOPSY AT RGH

Our preliminary data

Our Experience

Time period

Oct 2016 to date

Number of patients

106

Our Experience

Concordance

Definition: Clinically significant cancer on target

106 patients → 105 lesions PIRAD 3 to 5 → 44%

PRECISION: 38%

MGH: 34.5%

“Discordance”

Definition: No clinically significant cancer on target

FUTURE PROSPECTIVES

Future goals

- Targeted biopsy
 - A closed loop service
- MRI for risk stratification and active surveillance
 - The wave of the future?
